

OmniSeq's immune response assay is a targeted, next-generation sequencing (NGS) gene expression assay that measures RNA expression of genes associated with anti-tumor immune response markers including leukocyte subsets, antigen presentation, checkpoint pathways, and tumor progression. The assay measures the expression of genes involved in tumor-immune interactions, including the low-expressing genes involved in inflammatory signaling and 64 genes validated with NYS CLEP and clinically reported. The 395 gene expression panel is also separately available for research use.

### 395 Genes interrogated for expression of markers associated with the cancer-immunity cycle and tumor microenvironment
